

2. Next, the abovementioned implementation of the Machine Coaching cycle will be utilized in the development of a domain specific platform that will allow the machine coached agent to interact with other agents – as a first goal, human ones – and play chess against them.
3. Experiments against other chess playing agents will be carried out to empirically evaluate the efficiency of the machine coached agent.
4. Several extensions of the platform will be considered based on the results of the abovementioned experiments. For instance, the platform may be extended to play against other machine coached agents or be redesigned to extend to other games.
5. If possible, some theoretical conclusions may be discussed/proved about the abovementioned procedure.

Timetable

The final timetable that is to be followed is the following:

1. Today – 26/01/2020: Development of the chess playing platform and first experiments with human users.
2. 27/01/2020 – 15/02/2020: Conduction of further experiments with human users and systematic evaluation of the platform as well as the efficiency of the Machine Coaching Paradigm in game playing.
3. 16/02/2020 – end of academic year: Adjustment of the platform according to the results of the abovementioned experiments and possible extensions according to the previously discussed methodology and research questions – see relevant paragraphs for more.
